Data Analysis for Drug Repurposing for Effective Alzheimer's Medicines (DREAM) – Amiloride vs Triamterene

NCT05125237

July 11, 2022

1. Comparison Details

a. Intended aim(s)

To evaluate the comparative risk of dementia onset between patients treated with <u>amiloride versus triamterene</u> for hypertension.

b. Primary endpoint

Incident dementia (i.e., Alzheimer's disease, vascular dementia, senile, presenile, or unspecified dementia, or dementia in other diseases classified elsewhere).

2. Person responsible for implementation of replication in Aetion

Mufaddal Mahesri

3. Data Source(s)

Medicare, 2008-2018

5. Cohort Identification

a. Cohort Summary

This study will employ a new user, active comparator, observational cohort study design comparing amiloride to triamterene. The patients will be required to have continuous enrollment during the baseline period of 365 days before initiation of amiloride or triamterene (index date). Follow-up for the outcome (dementia) differs between analyses. Follow-up begins the day after drug initiation (analysis 1, 3, 4); 180 days after drug initiation (analysis 2).

b. Key details regarding cohort creation

Index date:

Day of initiation of new amiloride or triamterene use

Inclusion criteria for analyses 1, 3, 4:

- Aged ≥ 65 years on the index date
- 365 days enrollment in Medicare Parts A, B, and D with no HMO coverage
- No use of amiloride, triamterene any time prior to index date (all available lookback approach with a minimum of 365 days)
- No diagnosis of dementia any time prior to and including index date
- At least two claims with hypertension diagnosis recorded in 365 days prior to index date

Inclusion criteria for analysis 2:

- Aged ≥ 65 years on the index date
- 365 days enrollment in Medicare Parts A, B, and D with no HMO coverage
- No use of amiloride, triamterene any time prior to index date (all available lookback approach with a minimum of 365 days)
- No diagnosis of dementia any time prior to and including index date
- At least two claims with hypertension diagnosis recorded in 365 days prior to index date
- 180-day continuous use of amiloride or triamterene starting on the index date

6. Variables

a. Exposure-related variables:

Study drug:

The study exposure of interest is initiation of amiloride

Comparator:

Initiators of amiloride will be compared to initiators of triamterene

b. Covariates:

Demographics				
Age	Region			
Gender	Calendar year of index date			
Race	Low income subsidy			

Dementia risk factors					
Diabetes	Anxiety				
Obesity	Bipolar disorder				
Coronary artery disease	Schizophrenia				
Depression					

Markers for healthy behavior, frailty, healthcare use				
Smoking	Number of hospitalizations			
Mammography	Number of physician office visits			
Colonoscopy	Number of serum creatinine tests ordered			
Fecal occult blood test	Composite frailty score			
Influenza vaccination	Number of C-reactive protein tests ordered			
Pneumococcal vaccination	Osteoporosis			
Herpes zoster vaccination	Fractures			

Bone mineral density test	Falls
Number of distinct generic agents	Use of supplemental oxygen
Number of emergency room visits	Combined comorbidity score
Number of outpatient visits	

Comedication use				
Lithium	Nitrates			
Anti-epileptic mood stabilizers	Lipid lowering drugs			
Anti-epileptics (other than mood stabilizers)	Non-insulin diabetes medications			
Atypical antipsychotics	Insulin			
Benzodiazepines	Antidepressants			
Serotonin-norepinephrine reuptake Inhibitors	Typical antipsychotics			
Selective serotonin reuptake inhibitors	Anticoagulants			
Tricyclic antidepressants (TCAs)	Antiplatelet agents			

Comorbid conditions				
Atrial fibrillation	Chronic liver disease			
Coronary artery disease	Asthma			
Heart failure	Ischemic heart disease			
Stroke or transient ischemic attack	Chronic obstructive pulmonary disease			
Peripheral vascular disease	Malignancy			
Hyperlipidemia	Drug or alcohol abuse or dependence			
Renal dysfunction	Venous thromboembolism			

ICD-9, ICD-10, HCPCS, and NDC codes used to define the covariates listed above are available in Appendix A.

- c. Outcome variables and study follow-up:
- <u>Primary outcome</u>: incident dementia, i.e., Alzheimer's disease, vascular dementia, senile, presenile, or unspecified dementia, or dementia in other diseases classified elsewhere. Outcome will be defined by 1 inpatient claim or 2 outpatient claims in analysis 1, 2, 3. In analysis 4, the outcome will be defined by 1 inpatient or 1 outpatient claims and 1 prescription claim for a symptomatic treatment [donepezil, galantamine, rivastigmine, and memantine] within 6 months of each other with outcome date assigned to second event in the sequence.
- Secondary outcomes: Individual component:

Alzheimer's disease

Condition	ICD-9 and ICD-10 codes
Alzheimer's disease	331.0*, F00*, G30*
Vascular dementia	290.4*, F01*
Senile, presenile, or unspecified dementia	290.0*, 290.1*. 290.3*, 797*, F03*
Dementia in other diseases classified elsewhere	331.1*, 331.2*, 331.7*, 294.1*, F02*

For analysis 1,3, and 4 the follow-up will start the day after initiation of amiloride and triamterene and will continue until the earliest date of the following events:

- The first occurrence of the outcome of interest
- The date of end of continuous registration in the database,
- End of the study period,
- Measured death event occurs.
- The date of drug discontinuation, defined as the date of the last continuous treatment episode of the index drug (amiloride and triamterene) plus a defined grace period (i.e., 90 days after the end of the last prescription's days' supply in main analyses).

For analysis 2, the follow-up will start 180 days after initiation of amiloride and triamterene and will continue until the earliest date of the following events:

- The first occurrence of the outcome of interest, unless otherwise specified for selected outcomes,
- The date of end of continuous registration in the database,
- End of the study period,
- Measured death event occurs,
- Maximum allowed follow-up time (1095 days) reached

8. Propensity score analysis

We will use a propensity-score (PS)¹-based approach to account for measured confounding in this study. The PS will be calculated as the predicted probability of initiating the exposure of interest (i.e., the repurposing candidate) versus the reference drug conditional on baseline covariates using multivariable logistic regression constructed separately in each data source. On average, patients with similar PSs have similar distribution of potential confounders used to estimate the PS. Therefore, analyses conditioned on the PS provide effect estimates that are free from measured confounding. For all our analyses, initiators of each exposure of interest will be matched with initiators of the reference exposure based on their PS within each data source.² Pair matching will be conducted using a nearest-neighbor algorithm, which seeks to minimize the distance between propensity scores in each pair of treated and reference patients,³ and a caliper of 0.025 on the natural scale of the PS will be used to ensure similarity between the matched patients.⁴

We report multiple diagnostics for PS analysis in this protocol. First, the PS distributional overlap is provided between two groups before and after matching to ensure comparability of these groups.⁵ Next, balance in each individual covariate between two treatment groups is reported using standardized differences.⁶

9. Statistical analysis plans

Incidence rates for the outcome will be estimated for the treatment and reference groups before and after PS matching. The competing risk of death could be of concern for the current set of analyses if mortality is frequent among patients included in the cohort and if differences in the risk of mortality between treatment and reference groups are substantial. In the PS-matched sample, we will use cause-specific hazard models⁷ to provide hazard ratios averaged over the entire follow-up period as well as interval specific hazard ratios (1, 2, and 3 years) for the association between the treatment of interest and risk of ADRD after considering all-cause mortality as a competing event. Pre-specified subgroup analyses will be conducted based on age, sex, and baseline cardiovascular disease. In addition to the Medicare dataset, we will pursue a similar analysis within Clinical Practice Research Datalink (CPRD), a UK population health dataset, to validate our results.
