# Ameliorating the Impact of Complications and Errors on Surgeons: Resilience Training for Surgeons.

(Resilience Training for Surgeons)

## Research Protocol Version 1.1 11/06/18

#### Research Team Members (Role)

Dr. Helen Bolderston (Chief Investigator)

Mr Kevin Turner, MA DM FRS(Urol) (Principle Investigator)

Prof. Sine McDougall (co-investigator)

Dr Kevin Thomas (co-investigator)

Stephen Richer (Ph.D. Student)

Funders: Bournemouth University and Royal Bournemouth and Christchurch Hospitals NHS

Foundation Trust.

Sponsor: Bournemouth University.

Research Protocol: January 2018-January 2020

### 1: Background

There is a high likelihood that surgeons will experience adverse outcomes due to patient complications following surgery sometime during their careers (Patel et al., 2010). Such adverse events can have undesirable effects on the surgeon in terms of quality of life and mental well-being (e.g. anxiety, feelings of regret) and lowered professional confidence and impaired perceptions of professional competence. Furthermore, numerous studies have indicated that these kinds of negative impacts can also lead to burnout and depression, (Pinto 2011, Shanafelt 2012). As well as the detrimental effects on surgeons and those around them, this in turn may lead to more errors and poorer outcomes for patients.

Research in a range of occupational settings has indicated that resilience plays an important role in ameliorating the impact of adverse events in high pressure environments. This project will use a randomised controlled trial research design to assess the efficacy of brief one-to-one Acceptance and Commitment Training (ACTr), designed to enhance surgeons' psychological resilience. According to acceptance and commitment therapy (Hayes, 2004), psychological flexibility is implicated in psychopathology. Psychopathology is primarily the consequence of psychological inflexibility i.e. inability to persist or change behaviour according to long-term values due to language and cognition skills (Hayes, 2006), which has particular significance when an individual is confronted with stress or adversity.

## 2: Aims and Objectives

The main aim of our research is to assess the efficacy of a brief Acceptance and Commitment Training course. We wish to ascertain whether such a course can increase surgeons' resilience by increasing psychological flexibility, valuing and self-compassion (all of which are expected to be positively impacted by this training). This research will fill a gap in the relevant research literature; namely that no research project as far as we are aware has evaluated ACTr as a means to enhance resilience in surgeons. In fact any research conducted on resilience training with a surgical population is rare.

Research Protocol: January 2018-January 2020

4

3: Design

The proposed study will initially take the shape of a small pilot study (n=10) and following this a

randomised controlled trial. (n=100)

The intervention will consist of Acceptance and Commitment Training (ACTr), on a 1:1 basis. Flaxman

(2013) devised a workplace training program which will form the basis of this training protocol. ACT as a workplace training has been supported by numerous studies including Lappalainen et al (2007),

Finnes and Ghaderi (2017). A recent manual, Flaxman, Bond and Livheim (2013), will be utilised for

this study, with a bespoke tailoring to the surgeons' population. See section 12 for full details.

4: Participants

Trainee surgeons and consultant surgeons from local hospitals, initially Royal Bournemouth

 $Hospital,\, Bournemouth,\, Dorset;\, and\,\, Poole\,\, Hospital,\, Poole,\, Dorset.\,\, Then\,\, the\,\, John\,\, Radcliffe\,\, Hospital\,\, ,$ 

Oxford; Southampton General Hospital, Southampton and Portsmouth General Hospital.

5: Sampling

Strategy

Block randomisation (blocks of 4) will be used to help ensure equal-sized groups. An external

statistician will generate random blocks of 4.

Sample Size

For the RCT, we intend to recruit 100 to allow for some attrition and still have approximately 45 participants per condition. This number is based on previous studies(e.g Flaxman and Bond, 2010)

conducted using ACTr based training; this will give enough statistical power, particularly with regards

to mediation analysis.

6: Recruitment

Research Protocol: January 2018-January 2020

Recruitment will initially be through Royal Bournemouth Hospital and will be initiated by Mr Kevin Turner, MA DM FRCS(Urol) (Principal Investigator). An invitation email will be sent to potential participants (again identified by Mr Turner) and further information regarding the study will be forwarded to the potential participant on their request only.

#### 7: Randomisation

Participants will be allocated one of two groups, the experimental group (who will receive ACTr) or the wait-list control group. Participants allocated to the wait-list control will be offered the same ACTr sessions once the current study has ended.

#### 8: Data Collection

#### **Data Collection Points**

T1 – 2 Weeks before training session one. Via email/on-line questionnaires.

S1- First training session

Interval (4 weeks RCT, 2 weeks Pilot)

T2 – Immediately before the beginning of training session two.

S2 – Second Training session

Interval (4 weeks RCT, 2 weeks Pilot)

Research Protocol: January 2018-January 2020

T3 - Immediately before the beginning of training session three.

S3 – Third Training session

T4 –Within two week of completion of training session three.

T5- Follow-up, 12 weeks after training session three. Via email.

#### **Primary Outcome Measures**

Resilience - Brief Resilience Scale (BRS)

General Health - General Health Questionnaire (GHQ-12)

#### **Secondary Outcome and Process Measures**

CBI (Copenhagen Burnout Inventory)

DASS21 (Depression Anxiety and Stress Scale)

VLQ (Value Living Questionnaire)

WAAQ (Work related Acceptance and Action Questionnaire)

AAQII (Acceptance and Action Questionnaire)

SCS (Self Compassion Scale)

SPS (Sense of Preparedness Scale)

## 9: Data Analysis

Data will be analysed on an intention-to-treat basis. For the pilot study a series of analyses of variance with time (1-5) as a within-subjects factor will be employed to examine changes in outcome and process measures. For the RCT, a series of analyses of variance will be conducted with time(1-5) as a within-subjects factor and condition (treatment vs control) as a between-subjects factor.

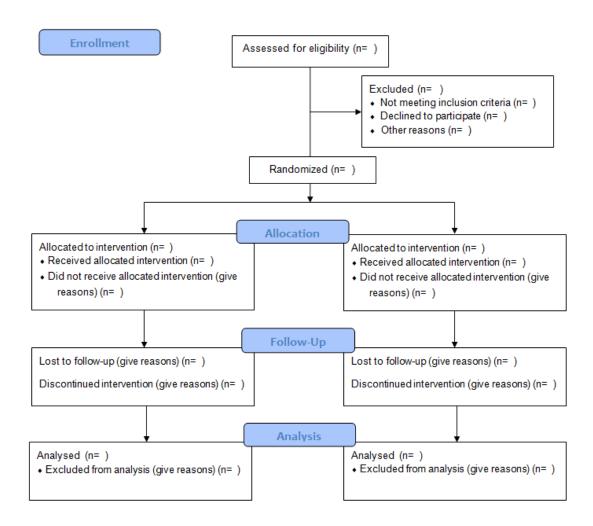

Mediation analysis based on regression will be used to test the role of study processes to ascertain whether outcome measure changes are mediated by process measures.

Furthermore the Jacobson and Truax (1991) method of assessing change for each individual participant will be used in both the pilot and the RCT studies. This will be used to determine whether the magnitude of change for a given client is statistically reliable.

Research Protocol: January 2018-January 2020

#### **CONSORT 2010 Flow Diagram**

Data collected will be presented and analysed descriptively. The consort flow diagram (2010, figure 1.) will be followed to document relevant recruitment data.

Figure 1 (Consort 2010 Flow Diagram)

#### 10: Ethical Considerations

Research Protocol: January 2018-January 2020

Ethical approval will be sought from the university ethics team and the Integrated Research Application System (IRAS). The researcher will undertake 'Good Clinical Practice' training. Informed consent will be gained at the time of recruitment and verbally prior to the start of each session Participants will be made aware of their right to withdraw at any time. In the highly unlikely event that participants experience an unexpected uncomfortable response during the session, emotional 'grounding techniques' will be utilised by the trainer. Furthermore, Clinical Psychologist Helen Bolderston (Chief Investigator) contact details will be made available to participants, as will details of the BMA's Doctors for Doctors website and helpline (who can offer ongoing counselling).

### 11: Data Protection and Storage

#### **Recordings**

Training sessions will be recorded as a further safeguard and assessment tool. The only purpose of recording the sessions is to ensure the ACTr process is being delivered accurately and correctly. Randomly selected section of sessions will be assessed by an independent ACTr assessor (Dr Bolderston will source the assessor and this will be kept on file) to rate fidelity to the established ACTr protocol. If, a randomly selected recording identifies the participant or anyone else, it will NOT be forwarded to the independent assessor, and another recording will be randomly selected.

#### **Data**

All information will be kept on a secure university hard drive. All data will be password protected. All data will be identified only by participant number. An Excel file linking participant to participant number will be kept on a separate drive, on a separate computer, password protected. Paperwork will be kept in a locked filing cabinet in a locked office at Bournemouth University,. Computers are both password secure and encrypted. NO personal information will be kept on laptop computers.

#### **Confidentiality**

The NHS code of confidentiality will be adhered to. Both Dr Helen Bolderston and Mr Kevin Turner are both NHS employees and as such have been trained within the last 12 months in Information Governance and Confidentiality. Bournemouth University staff will adhere to the requirements of the Data Protection Act. Furthermore, Access to personal data will be limited to the research team. All data will be anonymised at the earliest possible stage. Personal information will not be kept once participants have completed their 3-month follow-up session. Participants may withdraw at any time and all personal data will be destroyed if this is the case.

Research Protocol: January 2018-January 2020

## 12: Training Protocol with example timings.

## **Training Session 1**

- Develop a rapport with individuals and create a climate of safety and warmth.
- Describe the basic format, content and aim of the training.
- Install hope that training has the potential to be unusual, interesting and effective
- Range of empirically supported ACT exercises as per Flaxman, Bond and Livheim (2014) such as those outlined below

| Day 1 | Phase        | Intervention          | Detail   |
|-------|--------------|-----------------------|--|
| 9.00  | Welcome and  | Mindfulness or values | Re-consent   |
| 3.00  |              |                       |  |
|       | Introduction | warm-up exercise      | Recording sessions - rationale                                       |
|       |              |                       |  |
|       |              |                       | Designed to build rapport, engage and be 'ACT' consistent. To gather |
|       |              |                       | Designed to boild tapport, engage and be ACT consistent. To game     |
|       |              |                       | hopes and expectations for the training.                             |
|       |              |                       |  |
|       |              |                       |  |
|       |              |                       | Introductions  |

Research Protocol: January 2018-January 2020

name, work details, 2 activities they do on automatic pilot and 2
 activities they perform with more psychological awareness

We teach ACT skills experientially as well as didactically so there'll be a mix of information sharing, skills practices, discussion, goal setting etc.

**Confidentiality:** It's not therapy but it is personal.

What do you hope to get out of it personally?

Important to attend every session

It's a psychological and behavioural skills training program – training - not therapy

Research evidence

Training is not limited to work-related resilience and wellbeing – the skills can be applied to all areas of life

Practicing skills between sessions is an essential part of the training

| 9.20 | Overview of the | Presentation of two        | To offer empirical evidence for both ACT in occupational settings and |

## **Training Session 3**

(4 weeks after session 2 for RCT, 2 weeks for pilot)

- Booster Session.
- Further rehearsal of exercises; basic mindfulness training, physicalizing exercise, diffusion, mindfulness of thought, value-based goal and action planning.
- Range of empirically supported ACT exercises as per Flaxman, Bond and Livheim (2014) such as those outlined below.

| Day 3 | Phase           | Intervention        | Process/Reason/function   |
|-------|-----------------|---------------------|---|
| 8.45  | Data Collection | Collection of Data  |   |
| 9.00  | Welcome Back    | Two-skills diagram. | Welcome back to part three and to reaffirm the empirical evidence for both ACT in occupational settings and for particular processes or components - e.g. mindfulness  Also, any evidence to do with medical professional in particular |
| 9.10  | Opening         | Mindfulness of body | Preparation involves participant sitting in upright position, eyes  |

Research Protocol: January 2018-January 2020

| nd breath.          | closed or unfocused and cast down towards floor, hands resting       |  |  |  |  |  |  |
|---------------------|--|--|--|--|--|--|--|
|                     | comfortably on lap or arms of chair. Participant will be invited to  |  |  |  |  |  |  |
|                     | become aware of physical sensations before setting attention on      |  |  |  |  |  |  |
|                     | sensation of movement in the abdomen whilst breathing.               |  |  |  |  |  |  |
|                     | Function of starting with a mindfulness practice:                    |  |  |  |  |  |  |
|                     | Bring attention into the room and the present moment                 |  |  |  |  |  |  |
|                     | More likely to be fully engaged in later exercises if do mindfulness |  |  |  |  |  |  |
